

Exercise 3

Malo Jan

This is the third exercise of the course. Here, the goal is to learn about to explore and communicate information about the data through visualizations.

1. As with the previous exercises, you will need to create a new R project and a new quarto document. Save the quarto document in the same folder as 'lastname_ex3.qmd'.
2. Then, Download and import the [Chapell Hill Expert Survey trend file](#) into Rstudio. You can also just copy and paste the dataset that was used during the session into your exercise folder.
3. Then, look at the codebook and pick up a given issue that you are interested in : EU integration, immigration, environment, international relations, redistributions etc.
4. Using graphs, provide a brief analysis of variation in the position or salience of this issue across different variables such as party families, year or country. Feel free to restrict the analysis to a subset of countries or years. Be careful as some variables are only available for some years. You should find a way to use at least the following geoms : `geom_histogram()`, `geom_point()`, `geom_boxplot()` and facetting with `facet_wrap(~ )`
5. Optional : Try to polish the graph by adding titles, labels, colors, themes etc.
6. As always, convert the quarto document into a pdf or word document and submit it on the Moodle platform.
